AMENDMENTS

Amendments to the Claims

Please cancel claims 1-10 and 12-30 and add new claims 31-46, as indicated below. The following list of claims replaces all previous listings of the claims.

Claims 1-10. Cancelled.

11. (currently amended) A process according to claim-8, in which a first hydroxyl-substituted organic compound selected from the formulae R¹CH₂OH, R¹R²CHOH and R¹R²R³COH is exposed, optionally in the presence of one or more further organic compounds selected from second hydroxyl-substituted organic compounds of the formulae R⁴CH₂OH, R⁵R⁶CHOH, and R⁷R⁸R⁹COH and carbonyl compounds of the formula R¹⁰R ¹¹CO, to a heterogeneous catalyst which is able to provide a source of acid in a continuous flow reactor under supercritical conditions or at near-critical conditions for the fluid that is acting as solvent, with the result that an ether is formed from two hydroxyl-substituted organic compound molecules in a dehydration reaction, an acetal or ketal is formed by reaction between a hydroxyl-substituted organic compound molecule and a molecule of a said carbonyl compound, or an alkene product is produced by dehydration of a single hydroxyl-substituted organic compound molecule, wherein the conditions of temperature, pressure, and flow rate are controlled according to the product to be obtained, and wherein each of R¹ to R¹¹ is independently selected from: hydrogen or hydroxyl; an optionally substituted alkyl, alkenyl, alkynyl, aralkyl, cycloalkyl, cycloalkenyl, or aryl; or a heterocyclic group, wherein the catalyst is selected from: zeolites, metal oxides, molecular sieves, clays, or sulfonic acid derivatives and wherein the source of acid of the catalyst is provided by a sulfonic acid group.

Claims 12-30. Cancelled.

31. (new) A process in which reactants consisting only of an_organic compound having the formulae R¹CH₂OH, R¹R²CHOH or R¹R²R³COH optionally in the presence of one or more

further organic compounds having the formulae R⁴CH₂OH, R⁵R⁶CHOH, R⁷R⁸R⁹COH or R¹⁰R ¹¹CO, are exposed to a heterogeneous catalyst which is able to provide a source of acid in a continuous flow reactor under supercritical conditions with the result that an ether, acetal, ketal, or an alkene product is formed, wherein the conditions of temperature, pressure, and flow rate are independently, and wherein each of R¹ to R¹¹ is independently selected from: hydrogen or hydroxyl; an optionally substituted alkyl, alkenyl, alkynyl, aralkyl, cycloalkyl, cycloalkenyl, or aryl; or a heterocyclic group.

- 32. (new) A process according to claim 31, wherein each of R¹ to R¹¹ when present is an optionally substituted alkyl group.
- 33. (new) A process according to claim 32, wherein each of the alkyl groups independently contains not more than 10 carbon atoms in the carbon chain excluding optional substituents if present.
- 34. (new) A process according to claim 31, 32 or 33, wherein the total number of alcohol groups within the organic compound does not exceed three.
- 35. (new) A process according to claim 31, wherein the catalyst is selected from: zeolites, molecular sieves, clays or sulfonic acid derivatives.
- 36. (new) A process according to claim 35, wherein the catalyst is supported on an inert carrier.
- 37. (new) A process according to claim 35 or 36, wherein the catalyst includes a promoter.
- 38. (new) A process according to claim 35 or 36 wherein the acidity of the catalyst is provided by a sulfonic acid group.
- 39. (new) A process according to claim 37, wherein the acidity of the catalyst is provided by a sulfonic acid group.

- 40. (new) A process according to claim 31, wherein the reaction conditions are controlled in such a way that the products are selectively formed in high yield with insignificant rearrangement.
- 41. (new) A process according to claim 40, wherein the reactant molecules are aliphatic and/or aromatic alcohols
- 42. (new) A process as claimed in claim 41, wherein the reactant molecules are aliphatic alcohols.
- 43. (new) A process according to claim 31, in which the product is an ether.
- 44. (new) A process according to claim 43, in which the reactant(s) and the product are straightchain n-alkyl molecules.
- 45. (new) A process according to claim 40 or 41, wherein the reaction conditions can be controlled in such a way that a particular aliphatic alcohol is converted into an alkene in preference to an ether.
- 46. (new) A process according to claim 31, in which the reactant(s) form a single homogeneous phase.
